

Digital Signal Processing - Lecture 4

Negative frequencies, spectral leakage, and aliasing

Ewout Bergsma

Hanze University of Applied Sciences

Overview

This lecture

01 Negative frequencies

02 Spectral leakage

03 Nyquist frequency and aliasing

04 Exercises

| Negative frequencies

A two-sided spectrum

Frequency domain: <https://bigsoundbank.com/UPLOAD/wav/1234.wav>

Rotations in the complex plane

Source: <https://www.youtube.com/watch?v=SvFfVtRT1UI>

| Spectral leakage

One and two complete periods

One complete period

Two complete periods

One and a half periods

Comparing complete and partial periods

One and a half periods

Two complete periods

Nyquist frequency and aliasing

Continuous and discrete signals

Analog to digital conversion

Sample rate

Resolution

Source: https://commons.wikimedia.org/wiki/File:Resolution_illustration.png

What is the frequency?

One cycle per second

What is the frequency now?

One cycle per second with fewer samples

Can we distinguish these signals?

Aliasing

Aliasing in motion

Source: https://youtu.be/CTILCx5pHvM?si=TRD44vsEh_-Y7E3u

Nyquist frequency

$$f_{\text{Nyquist}} = \frac{1}{2} f_s$$

Half the sampling rate

The Nyquist frequency is half the sampling rate.

Why 44.1 kHz?

A common audio sample rate is 44.1 kHz, why?

We found 48 kHz previously, but that is beside the point.

What can we sample without aliasing?

?

Questions?

Exercises
